Write a java program to calculate the area of different shapes namely circle, rectangle and triangle using the concept of method overloading.

```
Class Area {
  double area(double r) {
   return (3.14*r*r); }
  double area (double l, double b) {
    return ( l* b); }
double area(double base, double h, boolean isTriangle)
     {
      return (0.5 * base * h);
       }

}
```

```
public class AreaMain {
 public static void main (String[] args) {
 Area a1 = new Area();
System.out.println (" Area of circle: " + a1.area(5));
System.out.println ("Area of Rectangle : " + a1.area(4,6));
System.out.println ("Area of Triangle : " + a1.area(3,8,True));
 }
}
```

Note:

Here, in the third method, boolean isTriangle is the parameter added for distinguishing methods of area of rectangle and triangle.
